

COMVAULT SIMPANA ASSESSMENT: Data Isn't Simple. But Your Backup And Recovery Can Be.

Your business is individual. Shouldn't your backup and recovery systems be customized to match? Sanity Solutions' Commvault Simpana Assessment and Site Review examines your current business needs and provides a review and recommendation to streamline your backup and recovery infrastructure. We'll help configure and install your applications and make sure you're doing everything you can to avoid problems.

Here's a short list of services we provide:

- **Business Requirement Assessment** – We'll make sure your goals for your business and your data backup are clear. This covers:
 - > Simpana Best Practices
 - > DR/Business Continuity
 - > Compliance
 - > Migration (HSM) and Archiving
 - > Etc.
- **Simpana CommCell Review** – We'll survey your current CommCell configuration (including DR Backup, security, critical Events, logging, etc.).
- **Simpana Configuration Review** – Are your schedules streamlined? Are your media management objectives being met? Are you as efficient as possible? We'll make recommendations on policy configuration, scheduling, media management and usage where applicable.
- **Procedural/Operational Validation** – We'll analyze your existing Galaxy reports and configuration data, and then make recommendations on operational monitoring processes, alerting mechanisms, and overall media management.

COMMVAULT SIMPANA ASSESSMENT: Data Isn't Simple. But Your Backup And Recovery Can Be. (continued)

- **Simpana Software Inventory and Compatibility Review** – We'll closely examine your software and firmware release levels, and then validate them against minimum CommVault and third-party requirements. Automated Simpana FTP update process may also be reviewed and implemented where applicable.
- **Simpana Applications Review** – We'll take a look at your data protection requirements for applications in their environment to confirm they're configured properly. Then we'll measure your actual level of protection against your goals.
- **Simpana Operational Review** – This is a full review of backup/restore successes, failures, root-causes, and exceeding data protection windows.
- **Simpana Scalability Review** – A full performance and load analysis of the hardware, network, and MediaAgent configuration(s). We'll examine your environment against CommVault Systems' developed Scalability and Sizing Guidelines for Workgroup, Enterprise and Datacenter deployments and then review scalability and sizing requirements against the current state of operations and projected data and server system growth.

Your system will grow, but your worries won't.

We can also make recommendations on anticipated and required changes to the Simpana environment (i.e. licensing, GridStor, Galaxy components, etc.) to grow the system while avoiding/eliminating serious performance degradation issues.
